Step 6 of 7 (f) The process of cellular respiration takes glucose and other organic molecules and through a series of reactions breaks them down to convert ADP and phosphate ions into ATP. The glucose is broken down during glycolysis and the citric acid cycle into the nonpolar molecule carbon dioxide and then released as waste.

Microtubules are at the heart of cellular self-organization, and their dynamic nature allows them to explore the intracellular space and mediate the transport of cargoes from the nucleus to the outer edges of the cell and back. In *Microtubule Dynamics: Methods and Protocols*, experts in the field provide an up-to-date collection of methods and approaches that are used to investigate microtubule dynamics in vitro and in cells. Beginning with the question of how to analyze microtubule dynamics, the volume continues with detailed descriptions of how to isolate tubulin from different sources and with different posttranslational modifications, methods used to study microtubule dynamics and microtubule interactions in vitro, techniques to investigate the ultrastructure of microtubules and associated proteins, assays to study microtubule nucleation, turnover, and force production in cells, as well as approaches to isolate novel microtubule-associated proteins and their interacting proteins. Written in the highly successful *Methods in Molecular Biology*<sup>TM</sup> series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Definitive and practical, *Microtubule Dynamics: Methods and Protocols* provides the key protocols needed by novices and experts on how to perform a broad range of well-established
