1.11. Let A be a Boolean ring. (i) Given x in A , $0 = (x+1)^2(x+1) = x^2+2x+1 \times 1 = 2x$: 1 RINGS AND IDEALS 11 (ii) If x is not an element of a prime ideal p , then $x(1-x) = 0$ implies that $x=1$ in A/p . Thus A/p is the field with two elements and p is a maximal ideal. (iii) Let x,y be elements of an ideal a .

If J denotes the Jacobson radical and R denotes the nilpotent radical, then $J \subseteq R$, since R is the intersection of all prime ideals, while J is the intersection of all prime and maximal ideals. Therefore, we only need to show $J \subseteq R$ in $A[x]$.

Indeed, if $f(x) \in J$, then $1 - f(x)g(x) \in A \setminus \mathfrak{p}$, for all $g(x) \in A[x]$.

There is no shortage of books on Commutative Algebra, but the present book is different. Most books are monographs, with extensive coverage. But there is one notable exception: Atiyah and Macdonald's 1969 classic [3]. It is a clear, concise, and efficient textbook, aimed at beginners, with a good selection of topics. So it has remained popular.

correspondence (Proposition 1.1 of Atiyah-MacDonald) and a remark on page 9 of Atiyah-MacDonald, \mathfrak{p} corresponds to a prime ideal \mathfrak{p} of $f(A)$, with $f^{-1}(\mathfrak{p}) = \mathfrak{p}$. Since \mathfrak{p} is integral over $f(A)$, by the going-up theorem (Theorem 5.10 of Atiyah-MacDonald), there exists $\mathfrak{q} \in \text{Spec } B$ so that $\mathfrak{q} \cap f(A) = \mathfrak{p}$. Then $f^{-1}(\mathfrak{q}) = \mathfrak{q} \cap f(A) = \mathfrak{p} = f^{-1}(\mathfrak{p}) = \mathfrak{p}$

An early example of this which Atiyah used repeatedly is the Penrose transform, which can sometimes convert solutions of a non-linear equation over some real manifold into solutions of some linear holomorphic equations over a different complex manifold.

First Published in 2018. Routledge is an imprint of Taylor & Francis, an Informa company.

There is no shortage of books on Commutative Algebra, but the present book is different. Most books are monographs, with extensive coverage. There is one notable exception: Atiyah and Macdonald's 1969 classic. It is a clear, concise, and efficient textbook, aimed at beginners, with a good selection of topics. So it has remained popular. However, its age and flaws do show. So there is need for an updated and improved version, which the present book aims to be.

This is a comprehensive review of commutative algebra, from localization and primary decomposition through dimension theory, homological methods, free resolutions and duality, emphasizing the origins of the ideas and their connections with other parts of mathematics. The book gives a concise treatment of Grobner basis theory and the constructive methods in commutative algebra and algebraic geometry that flow from it. Many exercises included.

Introductory account of commutative algebra, aimed at students with a background in basic algebra.

For those looking for an introduction to the area of commutative algebra, this book opens all the right doors and provides a clarity of understanding that all will welcome.

Originally published in 1985, this classic textbook is an English translation of *Einführung in die kommutative Algebra und algebraische Geometrie*. As part of the Modern Birkhäuser Classics series, the publisher is proud to make *Introduction to Commutative Algebra and Algebraic Geometry* available to a wider audience. Aimed at students who have taken a basic course in algebra, the goal of the text is to present important results concerning the representation of algebraic varieties as intersections of the least possible number of hypersurfaces and—a closely related problem—with the most economical generation of ideals in Noetherian rings. Along the way, one encounters many basic concepts of commutative algebra and algebraic geometry and proves many facts which can then serve as a basic stock for a deeper study of these subjects.

This book explores commutative ring theory, an important foundation for algebraic geometry and complex analytical geometry.

An introduction to abstract algebraic geometry, with the only prerequisites being results from commutative algebra, which are stated as needed, and some elementary topology. More than 400 exercises distributed throughout the book offer specific examples as well as more specialised topics not treated in the main text, while three appendices present brief accounts of some areas of current research. This book can thus be used as textbook for an introductory course in algebraic geometry following a basic graduate course in algebra. Robin Hartshorne studied algebraic geometry with Oscar Zariski and David Mumford at Harvard, and with J.-P. Serre and A. Grothendieck in Paris. He is the author of "Residues and Duality", "Foundations of Projective Geometry", "Ample Subvarieties of Algebraic Varieties", and numerous research titles.

This book intends to provide material for a graduate course on computational commutative algebra and algebraic geometry, highlighting potential applications in cryptography. Also, the topics in this book could form the basis of a graduate course that acts as a segue between an introductory algebra course and the more technical topics of commutative algebra and algebraic geometry. This book contains a total of 124 exercises with detailed solutions as well as an important number of examples that illustrate definitions, theorems, and methods. This is very important for students or researchers who are not familiar with the topics discussed. Experience has shown that beginners who want to take their first steps in algebraic geometry are usually discouraged by the difficulty of the proposed exercises and the absence of detailed answers. Therefore, exercises (and their solutions) as well as examples occupy a prominent place in this course. This book is not designed as a comprehensive reference work, but rather as a selective textbook. The many exercises with detailed answers make it suitable for use in both a math or computer science course.

Algebraic geometry is a fascinating branch of mathematics that combines methods from both, algebra and geometry. It transcends the limited scope of pure algebra by means of geometric construction principles. Moreover, Grothendieck's schemes invented in the late 1950s allowed the application of algebraic-geometric methods in fields that formerly seemed to be far away from geometry, like algebraic number theory. The new techniques paved the way to spectacular progress such as the proof of Fermat's Last Theorem by Wiles and Taylor. The scheme-theoretic approach to algebraic geometry is explained for non-experts. More advanced readers can use the book to broaden their view on the subject. A separate part deals with the necessary prerequisites from commutative algebra. On a whole, the book provides a very accessible and self-contained introduction to algebraic geometry, up to a quite advanced level. Every chapter of the book is preceded by a motivating introduction with an informal discussion of the contents. Typical examples and an abundance of exercises illustrate each section. This way the book is an excellent solution for learning by yourself or for complementing knowledge that is already present. It can equally be used as a convenient source for courses and seminars or as supplemental literature.
