Diagnosis & treatment of Dental caries

Approximal caries is common in primary molars so, in children considered to be at increased risk of developing dental caries and where posterior contacts are closed, a first set of bitewing radiographs should be taken at 4 years of age, or as soon as practically possible after that . In such children consideration should be given to repeating bitewings at least annually in the first instance.

Currently there is no reason, in most cases of cavitated caries lesions, to remove affected tissue. This book presents evidence-based research on the topic and provides assessments of diagnostic devices. It offers new insights into how a dentine carious cavity can be managed by either tissue removal or restoration. Methods for preserving dental tissue are presented and ample evidence highlights the need to seal with a quality restorative material. An update on how to conduct a randomized clinical trial is followed by a chapter on agreed upon terminology for supporting improved communication among oral health professionals around the world. This is a must-read for general practitioners, restorative
