Master's Thesis from the year 2015 in the subject Geography / Earth Science - Miscellaneous, , language: English, abstract: Improper management of solid waste poses many challenges to the stakeholders such as residents, council authorities, business community and other support groups. The general objective of the study is to assess the sustainability of waste management in Glendale. The researcher used case study research design in conjunction with mixed methods research in the study. Both qualitative and quantitative methodologies were used to collect data. The target population for the study consisted of residents of Valley, Westville Park and Sisk, council authorities, Environmental Management Agency (EMA) officer, waste collectors, members of community based organizations (CBOs) and the environmental health officer. The total population was 569 and the sample size was 235. Stratified systematic sampling was employed to select 220 households and the rest except CBO

Access Free Assessment Of Solid Waste Management In Liberia Unep

members were picked using purposive sampling. CBO members were selected using convenience sampling. Data were collected using self-administered questionnaire, interviews, focus group discussions (FGDs), observations as well as secondary data. Qualitative data was analysed thematically while quantitative data was analysed using statistical package for social sciences (SPSS) version 16.0 as well as Pearson Chi square test. The results of the study indicated that solid waste management in Glendale is inefficient. Four and half tonnes of waste is generated per day in Glendale but only 2.0tonnes is collected and 2.5tonnes is left uncollected. It was noted that the waste is mainly decomposable organic. There is widespread illegal dumping of waste, inconsistent collection of waste, insufficient provision of receptacles and the council's official dump site is illegal. The council dumped waste on an illegal dumpsite characterised by open dumping and burning of waste. It was also noted that the waste was not separated according to type at the source. The study recommended an increase in awareness campaigns to ensure a change in the attitudes of the residents especially in connection with managing sanitary waste. In addition, the council should play its part by collecting waste frequently by increasing the size of its fleet for waste collection. The decomposable organic waste should also be used for generation of biogas.

This book covers a broad group of wastes, from biowaste to hazardous waste, but primarily the largest (by mass and volume) group of wastes that are not hazardous, but also are not inert, and are problematic for three major reasons: (1) they are difficult to manage because of their volume: usually they are used in civil engineering as a common fill etc., where they are exposed to environmental conditions almost the

Access Free Essment Of Solid Waste Management In Liberia Unep

same way as at disposal sites; (2) they are not geochemically stable and in the different periods of environmental exposure undergo transformations that might add hazardous properties to the material that are not displayed when it is freshly generated; (3) many designers and researchers in different countries involved in waste management are often not aware of time-delayed adverse environmental impact of some large-volume waste, and also do not consider some positive properties that may extend the area of their environmentally beneficial application.

This book reports research on policy and legal issues, anaerobic digestion of solid waste under processing aspects, industrial waste, application of GIS and LCA in waste management, and a couple of research papers relating to leachate and odour management.

Solid waste management affects every person in the world. By 2050, the world is expected to increase waste generation by 70 percent, from 2.01 billion tonnes of waste in 2016 to 3.40 billion tonnes of waste annually. Individuals and governments make decisions about consumption and waste management that

Access Free Assessment Of Solid Waste Management In Liberia Unep

affect the daily health, productivity, and cleanliness of communities. Poorly managed waste is contaminating the world's oceans, clogging drains and causing flooding, transmitting diseases, increasing respiratory problems, harming animals that consume waste unknowingly, and affecting economic development. Unmanaged and improperly managed waste from decades of economic growth requires urgent action at all levels of society. *What a Waste 2.0: A Global Snapshot of Solid Waste Management to 2050* aggregates extensive solid waste data at the national and urban levels. It estimates and projects waste generation to 2030 and 2050. Beyond the core data metrics from waste generation to disposal, the report provides information on waste management costs, revenues, and tariffs; special wastes; regulations; public communication; administrative and operational models; and the informal sector. Solid waste management accounts for approximately 20 percent of municipal budgets in low-income countries and 10 percent of municipal budgets in middle-income countries, on average. Waste management is often under the jurisdiction of local authorities facing competing priorities and limited resources and capacities in planning, contract management, and operational monitoring. These factors make sustainable waste management a complicated proposition; most low- and middle-income countries, and their respective cities, are struggling to address these challenges. Waste management data are critical to creating policy and planning for local contexts. Understanding how much waste is generated—especially with rapid urbanization and population growth—as well as the types of waste generated helps local governments to select appropriate management methods and plan for future demand. It allows governments to design a system with a suitable number of vehicles, establish efficient routes, set targets for diversion of waste, track progress, and adapt as consumption patterns change. With accurate data, governments can realistically allocate resources, assess relevant technologies, and consider strategic partners for service provision, such as the private sector or nongovernmental
