This best-selling introduction to the techniques and applications of management science is designed to make the subject easy to understand, interesting, and accessible for readers with limited mathematical background or skills. The book focuses on management science not only as a collection of techniques and processes, but as a philosophy and method for approaching problems in a logical manner.KEY TOPICS: Following a Obegin-from-the-basicsO approach for all topics, this book provides comprehensive coverage and flexible organization but does not assume an understanding of the mathematical underpinnings of any topic on the part of the reader. Each short, easy-to-read chapter centers around simple, straightforward examples that demonstrate the fundamentals of the techniques and provide specific solution steps that can be applied to other situations. Demonstrates how management science techniques can improve efficiency and save money. It also interweaves computer usage throughout every chapter. The sixth edition of Introduction to Management Science has been revised to reflect the most up-to-date practices and techniques. It now includes a revised discussion on the modeling process and new discussions the Analytical Hierarchy Procedure (AHP) and Multiple Regression. It also includes Excel Spreadsheet Solutions, including Excel QM, Crystal Ball software, and TreePlan software. An essential reference book for every professional manager.ÿ

Biochar is the carbon-rich product when biomass (such as wood, manure or crop residues) is heated in a closed container with little or no available air. It can be used to improve agriculture and the environment in several ways, and its stability in soil and superior nutrient-retention properties make it an ideal soil amendment to increase crop yields. In addition to this, biochar sequestration, in combination with sustainable biomass production, can be carbon-negative and therefore used to actively remove carbon dioxide from the atmosphere, with major implications for mitigation of climate change. Biochar production can also be combined with bioenergy production through the use of the gases that are given off in the pyrolysis process. This book is the first to synthesize the expanding research literature on this topic. The book's interdisciplinary approach, which covers engineering, environmental sciences, agricultural sciences, economics and policy, is a vital tool at this stage of biochar technology development. This comprehensive overview of current knowledge will be of interest to advanced students, researchers and professionals in a wide range of disciplines.

A key goal of fisheries management is to regulate extractive pressure on a resource so as to ensure social, economic and ecological sustainability. This text provides an accessible entry point for students and professionals to management science as developed in fisheries, in order to facilitate uptake of the latest ideas and methods. Traditional management approaches have relied upon a stock assessment based on existing understanding of resource status and dynamics, and a prediction of the likely future response to a static management proposal. However all such predictions include an inherent degree of uncertainty, and the last few decades have seen the emergence of an adaptive approach that uses feedback control to account for unknown future behaviour. Feedback is achieved via a control rule, which defines a relationship between perceived status of the resource and a management action. Evaluations of such rules usually include computer simulation testing across a broad range of uncertainties, so that an appropriate and robust rule can be selected by stakeholders and managers. The book focuses on this approach, which is usually referred to as Management Strategy Evaluation. The book is enriched by case study examples from different parts of the world, as well as insights into the theory and practice from those actively involved in the science of fisheries management.
