A lesson on isometric drawing. Hopefully you like it. I use the isometric dotted paper but the lesson could easily be adapted to use the isometric grid. There is a need to have multi link blocks for this lesson or something similar as the lesson is highly interactive with the blocks. Isometric paper included to print off.

Isometric Drawings Resources | Tes

Pupils learn about plan, front and side elevations and how to draw objects on isometric paper. The worksheet has an investigation into making objects with 5 cubes, as well as some challenging questions on building objects based on their elevations, with as few cubes as possible.

Engage students in mathematics using growth mindset techniques The most challenging parts of teaching mathematics are engaging students and helping them understand the connections between mathematics concepts. In this volume, you'll find a collection of low floor, high ceiling tasks that will help you do just that, by looking at the big ideas at the seventh-grade level through visualization, play, and investigation. During their work with tens of thousands of teachers, authors Jo Boaler, Jen Munson, and Cathy Williams heard the same message—that they want to incorporate more brain science into their math instruction, but they need guidance in the techniques that work best to get across the concepts they needed to teach. So the authors designed Mindset Mathematics around the principle of active student engagement, with tasks that reflect the latest brain science on learning. Open, creative, and visual math tasks have been shown to improve student test scores, and more importantly change their relationship with mathematics and start believing in their own potential. The tasks in Mindset Mathematics reflect the lessons from brain science that: There is no such thing as a math person - anyone can learn mathematics to high levels. Mistakes, struggle and challenge are the most important times for brain growth. Speed is unimportant in mathematics. Mathematics is a visual and beautiful subject, and our brains want to think visually about mathematics. With engaging questions, open-ended tasks, and four-color visuals that will help kids get excited about mathematics, Mindset Mathematics is organized around nine big ideas which emphasize the connections within the Common Core State Standards (CCSS) and can be used with any current curriculum.

Engage students in mathematics using growth mindset techniques The most challenging parts of teaching mathematics are engaging students and helping them understand the connections between mathematics concepts. In this volume, you'll find a collection of low floor, high ceiling tasks that will help you do just that, by looking at the big ideas at the third-grade level through visualization, play, and investigation. During their work with tens of thousands of teachers, authors Jo Boaler, Jen Munson, and Cathy Williams heard the same message—that they want to incorporate more brain science into their math instruction, but they need guidance in the techniques that work best to get across the concepts they needed to teach. So the authors designed Mindset Mathematics around the principle of active student engagement, with tasks that reflect the latest brain science on learning. The book is about me and my interaction with students, faculty, and everyone else. I want to move through my life from birth to the present. The 85 years of life have been eventful, and I am grateful for those who helped me arrive at this point in life. I want to convey the events that guided me through my early years, grade, high school, Army, marriage, college, teaching, and retirement. Each day was a learning experience. The goal was to make teaching more rewarding to the students. Many assignments that are included were not present when I started in 1965. My work during the summers helped me understand the innovations – NC (numerical control), CNC (computer numerical control), EDM (electric discharge machining). That learning helped me convey that knowledge to the students. Included are jobs made by the students that were designed to provide similar experiences found in the machining industry. There are stories about students and teachers that filled my days as a teacher. Lastly, there are assignments a person can try. My only comment is, “don’t do the last two because they are difficult.” That was a favorite comment to get students to work the difficult problems.

This student-friendly text is endorsed by Edexcel and matched to the specification unit by unit. To help students make the step up from GCSE the book is divided into an AS section and an A2 section, reflecting the greater challenges of the A2 year. The book is organised into two halves. The AS section uses double page spreads and easier language, to give students the confidence in making the difficult step up from studying at GCSE level. A2 work is written in chapters, at exactly the level needed to achieve this qualification. Each unit begins with a summary explaining what is expected and how it will be assessed. By giving students plenty of advice on what examiners are looking for, we help them prepare thoroughly to do their best in this qualification. A student checklist at the end of each unit is ideal for revision. Practice exam questions are included to give students even more confidence in those units which are assessed by a written paper. Focused practical tasks and homework suggestions appear throughout the book. Where any of the activities are likely to lead to students producing evidence for their Key Skills portfolio, this is highlighted clearly. Two coursework units in the book will give advice to students about the coursework part of the qualification. Also included are examples of the student work done during the Edexcel pilot for this specification, so readers can see the type of work required.
