In queueing theory, a discipline within the mathematical theory of probability, an M/M/1 queue represents the queue length in a system having a single server, where arrivals are determined by a Poisson process and job service times have an exponential distribution. The model name is written in Kendall's notation. The model is the most elementary of queueing models and an attractive object of study as closed-form expressions can be obtained for many metrics of interest in this model. An extension

These functions are not finished, for example the M/M/K algorithm assumes $K = 3$ and does something like this: $st = \text{exprnd}(\mu, 1, nv)$; $st = [st; \text{exprnd}(\mu, 1, nv)]$; $st = [st; \text{exprnd}(\mu, 1, nv)]$; with st = service times, eg $st(2,3)$ = service time for the third customer by the second worker

As we have seen earlier, M/M/1 refers to negative exponential arrivals and service times with a single server. This is the most widely used queueing system in analysis as pretty much everything is known about it. M/M/1 is a good approximation for a large number of queueing systems.
