Medico-legal and ethical issues. (p. 107) Medico-legal and ethical issues. The doctrine of informed consent is an important concept in medical care, but presents challenges in the critical care setting, where patients may have diminished capacity to provide their own informed consent. The elements of informed consent include adequate disclosure of information, cognitive capacity of individuals to make decisions, and the voluntary nature of such decisions.

Abstract. In obstetric anaesthetic practice, ethical and medico-legal problems revolve mainly around the ability of a woman in labour to give truly informed consent and the potential conflict between the best interests of the fetus and the mother. This contribution considers whether a woman in labour can be 'competent', the validity of birth plans, issues concerning information, maternal-fetal conflict and negligence claims.

Published in 1998, this work is concerned, in the main, with reproduction - for which marriage is not an essential prerequisite. Nevertheless, much of sexuality and the greater part of parenthood still subsist within the marital relationship. Sex and marriage are interdependent - indeed the definition of the latter depends on the former. After looking at the prerequisites for marriage and for making a marriage void, the author shows that the medico-legal interests of marriage relate to the mental health and the sex of the parties. The author also looks at various aspects of the sexual-familial relationship, including contraception, sterilization, abortion, protection of the foetus, foetal experimentation, the infertile husband, the infertile woman, defective neonates and infants, consent to treatment and research in children, the protection of young children and the killing of children within the family. Cases are used to highlight the legal aspects of these subjects.

A one-stop reference for all medical professionals who encounter ethicolegal problems during their management of patients.
Those involved in family and sexual relationships today face a bewildering variety of medico-legal dilemmas. These are encountered from as early as the preconception state of the embryo and continue throughout the period of child raising until the status of the mature minor is achieved. This book dissects a wide range of legal, medical and ethical issues surrounding reproduction and the parental relationship with the resultant child. Questions posed in the various sections include: what constitutes sexual intercourse, what are the implications of contraception and sterilization, is the abortion issues dead?. Is there a right to reproduce and, if so, how is this applied to the modern methods of assisted reproduction?. Is surrogate motherhood acceptable or workable?. The concept of fetal rights is explored and specific attention is given to the management of defective neonates in the light of recent judicial decisions. Other chapters look at the parent/child relationship in respect of medical treatment and the book concludes with a review of the interfamilial protection of young children under both the civil and the criminal law. Many of the views expressed are novel in that they represent those of a medical doctor exploring the legal field. It is neither a conventional book on family law nor one on medical law, rather, it draws on both to examine a specific area which affects both in a particularly significant way. Both statute and case law have been extensively updated since the publication of the first edition.

This is your source for authoritative and comprehensive guidance from the British Medical Association (BMA) Medical Ethics Department covering both routine and highly contentious medico-legal issues faced by health care professionals. The new edition updates the information from both the legal and ethical perspectives and reflects developments surrounding The Mental Capacity Act, Human Tissue Act, and revision of the Human Fertilisation and Embryology Act.

Medical Ethics - General Practice: The Integrative Approach Series - ' Ethics ' is a word derived from the Greek ethikos, which means ' habit ' or ' custom '. Put simply, in modern usage it is the study of how we ought to live or act in response to the situations confronting us in daily life. Medical ethics in particular is a branch of bioethics and is the study of how we ought to live or act as doctors. Ethics, being a branch of philosophy, relates to things such as ' right ', ' wrong ', ' duty ' and ' morality '. Making decisions of an ethical nature in medical practice is often difficult and demanding, and the clinician has to balance medical considerations with legal and moral ones. Taking the time to reflect upon ethical issues, and having a structured approach to doing this, can help clinicians to navigate through many potentially challenging situations. Not taking time for this can compound ethical and moral concerns. This has effects upon our wellbeing and can also have medico-legal implications. As with many medico-legal dilemmas, ethical problems are often compounded by poor communication. This chapter does not present a detailed analysis of particular and complex bioethical issues such as euthanasia, stem cell research or abortion. Nor does it make concrete pronouncements about the ' correct ' view on given topics or course of action in given situations. It does, however, give an overview of generic ethical terms, concepts and methods that can be applied by the clinician to particular situations. We are interested here in ' applied ethics ' and not simply ' theoretical ethics ' or ' meta-ethics '.

The competition for limited health care resources is intensifying. We urgently need an acceptable method for deciding how they should be allocated. But the goods that health care produces are of very different kinds. Health care can extend the lives of children and of older people. It can make it possible for a person to walk, when without health care that person would be permanently bedridden; and it can reduce the pain and distress of people who are terminally ill. How can we possibly decide which of these - and many more - diverse achievements of health care are more deserving than others? We need a common unit by which we might be able to measure these very different goods. The Quality-Adjusted Life Year, or QALY, is the most developed proposal for such a unit of measure. In this book a distinguished team of ethicists and economists defend the core of the QALY proposal: that health care resources should be used so as to produce more years of life, of the highest possible quality. This leads to a discussion of such fundamental questions as whether all lives are of equal value, whether health care should be allocated on the basis of need and whether the QALY approach incorporates an adequate account of fairness or justice. The result is the most thorough account yet of the ethical issues raised by the use of the QALY as a basis for allocating health care resources.
