Market_Desc: - Chemical Engineers - Biochemists - Students of Chemistry Special Features: - Includes problems requiring Mathematica, which allows readers to compute and visualize simultaneously. Expanded coverage of the uses of statistical mechanics, nuclear magnetic relaxation, nanoscience, and oscillating chemical reactions - Increased emphasis on the thermodynamics and kinetics of biochemical reactions including the denaturation of proteins and nucleic acids About The Book: A leading book for 80 years, Physical Chemistry 4e features exceptionally clear explanations of the concepts and methods of physical chemistry. The basic theory of chemistry is presented from the viewpoint of academic physical chemists, but the many applications of physical chemistry to practical are integrated throughout the book. The problems in the book are also a skillful blend of theory and practical applications.

Thermodynamics of Biochemical Reactions emphasizes the fundamental equations of thermodynamics and the application of these equations to systems of biochemical reactions. This emphasis leads to new thermodynamic potentials that provide criteria for spontaneous change and equilibrium under the conditions in a living cell.

Excerpt from Outlines of Theoretical Chemistry The author is fully convinced from his own experience as well as from that of his colleagues, that the complete mastery of the fundamental principles of the science is best attained through the solution of numerical examples. For this reason, typical problems have been appended to various chapters of the book. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Navigate the complexities of biochemical thermodynamics with Mathematica(r) Chemical reactions are studied under the constraints of constant temperature and constant pressure; biochemical reactions are studied under the additional constraints of pH and, perhaps, pMg or free concentrations of other metal ions. As more intensive variables are specified, more thermodynamic properties of a system are defined, and the equations that represent thermodynamic properties as a function of independent variables become more complicated. This sequel to Robert Albery's popular Thermodynamics of Biochemical Reactions describes how researchers will find Mathematica(r) a simple and elegant tool, which makes it possible to perform complex calculations that would previously have been impractical. Biochemical Thermodynamics: Applications of Mathematica(r) provides a comprehensive and rigorous treatment of biochemical thermodynamics using Mathematica(r) to practically resolve thermodynamic issues. Topics covered include: * Thermodynamics of the dissociation of weak acids * Apparent equilibrium constants * Biochemical reactions at specified temperatures and various pHs * Uses of matrices in biochemical thermodynamics * Oxidoreductase, transferase, hydrolase, and lyase reactions * Reactions at 298.15K * Thermodynamics of the binding of ligands by proteins * Calorimetry of biochemical reactions Because Mathematica(r) allows the intermingling of text and calculations, this book has been written in Mathematica(r) and includes a CD-ROM containing the entire book along with macros that help scientists and engineers solve their particular problems.

Rapid-Equilibrium Enzyme Kinetics helps readers emphasize the estimation of kinetic parameters with the minimum number of velocity measurements, thereby reducing the amount of laboratory work necessary, and allowing more time for the consideration of complicated mechanisms. The book systematically progresses through six levels of understanding the enzyme-catalyzed reaction, and includes a CD-ROM so that the reader may use the programs in the book to input their own experimental data.

This book provides a fresh, photon-based description of modern molecular spectroscopy and photophysics, with applications drawn from chemistry, biology, physics and materials science. The concise and detailed approach includes some of the most recent devel
