The book has been extensively revised and updated, to reflect the current standards of emergency care relevant to the needs of pediatricians working in developing countries. The present edition continues with its tradition of serving the needs of physicians involved in the immediate care of children and neonates with life-threatening illnesses. This book continues to have the privilege of scholarly writings from illustrious authors, across the country. A number of chapters have been completely rewritten, including those on hematological disorders, upper gastrointestinal bleeding, neonatal surgical disorders, and ophthalmologic emergencies. We hope that this text shall continue to serve the needs of pediatricians, physicians, resident doctors, other trainees and be a part of all pediatric emergency units. For the practitioners of pediatric care, emergencies in children and neonates are an inescapable fact in their daily routine. Better understanding of pathophysiology and drug metabolism and availability of newer investigative and diagnostic facilities have led to the creation of new frontiers in this important subject. Prompt recognition and appropriate management of these emergencies make the difference between life and death. The present publication has been extensively updated and enlarged from the earlier experiment which now appears like a distant cousin. Guidelines have also been incorporated for organization of pediatric intensive care units. This volume is intended for pediatricians and physicians sharing initial contact with emergencies in children and neonates as well as those responsible for the

subsequent critical and intensive care. Postgraduate students should find it of particular help. The book should also prove invaluable for all current and intended pediatric emergency care units. It is reasonably detailed and is a good blend of latest developments in the management approach in various pediatric and neonatal emergencies within the constraints of resources and equipment faced at most of the places. This book will fulfill all needs of both, the practicing pediatricians and postgraduate students in dealing with emergencies.

This first edition of Principles and Practice of Pediatric Endocrinology brings together 30 authors from 4 countries to present an update on the molecular basis of endocrine disorders in infants, children and adolescents as well as the diagnosis and treatment of these conditions. It is intended for the use of practitioners, fellows and clinical and “bench-top” researchers in this field, and presents advances in each of 12 areas of the normal and abnormal endocrine state. The work is a tribute to all those past and present whose research and clinical efforts resulted in the rapidly increasing accumulation of knowledge in this field, and includes comprehensive, practical clinical presentations in the form of an Atlas following each chapter after the comprehensive introductory chapter by Drs. Root and Rogol. This publication owes a great debt to Lawson Wilkins, a Baltimore pediatrician who first formally established the separate discipline of pediatric endocrinology, to Edwards Park, Fuller Albright, Bob Blizzard, Claude Migeon, Harold and Helen Harrison, James Tanner and to so many others: giants upon whose

shoulders pediatric endocrinologists stand. Disorders of growth and pubertal development are the cornerstones of pediatrics as they are present in many children with chronic illness as well as in children whose growth and pubertal development are influenced by genetics and family history. These may have identifiable causes in pituitary, thyroid, adrenal or gonadal function, and examples are well represented in this book. Obesity and diabetes (types I and 2) are, likewise, diseases of childhood that are becoming increasingly and significantly prevalent and are included in this work. Disorders of calcium/phosphorus (especially the often forgotten but not gone Vitamin D deficiency rickets) and water metabolism are presented, and errors of sexual differentiation (an increasingly controversial issue) are highlighted. It is the hope of the editors that this work will assist the practitioner and researcher in this field in his or her efforts to diagnose, treat and establish the etiology of endocrine disorders in infants, children and adolescents.
