Most prognostic factors literature describes those factors that directly relate to the tumor itself. However, many other factors, not directly related to the tumor, also affect the outcome. To comprehensively represent these factors we propose three broad groupings of prognostic factors: 'tumor'-related prognostic factors, 'host'-related prognostic factors, and 'environment'-related prognostic factors.

Many Factors Can Affect Your Prognosis. Some of the factors that affect prognosis include: The type of cancer and where it is in your body; The stage of the cancer, which refers to the size of the cancer and if it has spread to other parts of your body; The cancer 's grade, which refers to how abnormal the cancer cells look under a microscope. Grade provides clues about how quickly the cancer is likely to grow and spread.

role in the management of female breast cancer. The standard prognostic factors currently applied in new cases of breast cancer include axillary lymph node status, histologic subtype, tumor size, nuclear grade, hormone receptor status, measures of proliferation, and molecular markers such as HER2 overexpression. Of these, the presence or absence of metastatic carcinoma in the axillary lymph nodes is the most powerful ...

Prognostic and predictive factors are universally utilized in the management of breast cancer and can be used to stratify patients into two groups: (1) those who are expected to derive the most benefit from adjuvant systemic therapy, which includes all patients with lymph node metastases and a subset of node-negative patients, and (2) those for

[1], in a systematic overview of prognostic factors for non-small cell lung cancer, identified 887 articles published during a decade and more than 150 possible prognostic factors for non-small cell lung cancer. A prognostic factor is generally defined as a factor, measured before treatment, that has an impact on a patient's outcome "independently" of received treatment or of the general class of treatment.

Background: Treatment of metastatic breast cancer (MBC) remains palliative. Patients with MBC represent a heterogeneous group whose prognosis and outcome may be dependent on host factors. M. K. Gospodarowicz, P. Hermanek, and D. E. Henson Attention to innovations in cancer treatment has tended to eclipse the importance of prognostic assessment. However, the recognition that prognostic factors often have a greater impact on outcome than available therapies and the proliferation of biochemical, molecular, and genetic markers have resulted in renewed interest in this field. The outcome in patients with cancer is determined by a combination of numerous factors. Presently, the most widely recognized are the extent of disease,

histologic type of tumor, and treatment. It has been known for some time that additional factors also influence outcome. These include histologic grade, lymphatic or vascular invasion, mitotic index, performance status, symptoms, and most recently genetic and biochemical markers. It is the aim of this volume to compile those prognostic factors that have emerged as important determinants of outcome for tumors at various sites. This compilation represents the first phase of a more extensive process to integrate all prognostic factors in cancer to further enhance the prediction of outcome following treatment. Certain issues surrounding the assessment and reporting of prognostic factors are also considered. Importance of Prognostic Factors Prognostic factors in cancer often have an immense influence on outcome, while treatment often has a much weaker effect. For example, the influence of the presence of lymph node involvement

Prognostic Factors in Cancer, Second Edition updates the first authoritative monograph on prognostic factors and their use in planning treatment for cancer patients. The text is an extension of the work of the International Union Against Cancer (UICC) on the TNM Classification of Malignant Tumours and their current focus on prognostic factors in cancer. The TNM classification is the most widely used system for staging the progression of cancer. The anatomic extent of disease represented by the TNM system is the single most important predictor for outcomes of most tumors. Prognostic Factors in Cancer, Second Edition is divided into two parts. The first section examines

prognosis in general and more specifically prognosis in cancer patients, including issues surrounding accuracy of measurement of prognosis, the methodology of studying and classifying prognostic factors, and the application of prognostic factors in clinical decision-making in the treatment of cancer. The second section provides chapters on site-specific or tumor-specific neoplasms and the prognostic factors associated with them. These chapters contain an overview of the relevant literature and include summaries that classify prognostic factors according to subject and relevance. Prognostic Factors in Cancer, Second Edition illustrates the scope of the field as it stands today, and will provide perspective on likely outcomes of neoplastic disease for all physicians and others responsible for the care of patients with cancer.

This title reviews the key prognostic factors in breast cancer, discussing the methodologies involved in measuring and reporting. It also examines the roles of major predictive markers such as the steroid receptors, p53 and HER-2. Given the wealth of information in the medical literature on breast cancer, this volume is useful in that it focuses strictly on these factors. That focus makes this text extremely useful for oncologists and researchers who want to learn more about best practices in prognoses.

Predicting survival and other outcomes is increasingly being recognized as an important skill for palliative care physicians, internists, and other health care professionals who care for patients with advanced cancer at the end of life. There is much prognostic information available that is scattered throughout the palliative care and oncological literature but this is the first time it has been gathered systematically in one place. This book has 36 chapters divided into three sections. The first is an introductory section that deals with the principles of prognostication, including formulating the prediction and then communicating it. Topics such as statistical issues, evidence based medicine, and the ethics of prognostication are also covered. The second section addresses prognostication in fifteen specific cancers when they have reached the advanced stage. The third section deals

This comprehensive and easy-to-read monograph is an authoritative update on clinical prostate cancer. It has been prepared by an international, multidisciplinary team at the invitation of the International Prostate Health Council think tank. A particular strength of the book is its presentation of the therapeutic options for patients with localized and advanced disease, including hormonal treatment.
