Shield of Dreams: Missile Defense and U.S.-Russian Nuclear Strategy by Stephen J. Cimbala. Naval Institute Press, 2008, 256 pp. Stephen J. Cimbala's Shield of Dreams offers more than a traditional overview of and discourse on missile defense. In this well-written text, the author seeks to show the reader how strategic force models with different force-structure configurations would affect any missile defense configuration.

This book examines the implications of deploying missile defences by the United States and Russia within the current and next decades. Noting that U.S. plans to locate parts of the global ballistic missile defence system in eastern Europe contributed to a deterioration in U.S.-Russian relations, Cimbala discusses how a post-Bush/post-Putin era could open the door either to improved detente or increased acrimony over such issues as missile defences and NATO enlargement, the fate of the CFE and INF treaties, and U.S. hegemony in world politics.

Missile defenses are back. As Cimbala shows, the end of the Cold War revived interest in U.S. ballistic missile defenses because they now seem more feasible, with the Soviet Union gone and the perceived threat defined as light or accidental nuclear attacks, and because technology is thought by some experts and missile defense advocates to provide options not previously viable. Opponents of U.S. missile defenses claim that they will wreck the ABM Treaty, cause deterioration in the poliitcal relationship between the United States and Russia, alienate some NATO allies, and provoke China into offsetting increases in its long-range, nuclear-armed ballistic missile forces.

This book examines the transformation in US thinking about the role of Ballistic Missile Defence (BMD) in national security policy since the end of the Cold War. The evolution of the BMD debate after the Cold War has been complex, complicated and punctuated. As this book shows, the debate and subsequent policy choices would often appear to reflect neither the particular requirements of the international system for US security at any given time, nor indeed the current capabilities of BMD technology. Ballistic Missile Defence and US National Security Policy traces the evolution of policy from the zero-sum debates that surrounded the Strategic Defense Initiative as Ronald Reagan left office, up to the relative political consensus that exists around a limited BMD deployment in 2012. The book shows how and why policy evolved in such a complex manner during this period, and explains the strategic reasoning and political pressures shaping BMD policy under each of the presidents who have held office since 1989. Ultimately, this volume demonstrates how relative advancements in technology, combined with growth in the perceived missile threat, gradually shifted the contours and rhythm of the domestic missile defence debate in the US towards acceptance and normalisation. This book will be of much interest to students of missile defence and arms control, US national security policy, strategic studies and international relations in general.

" This revised and updated edition identifies the cultural factors and specific administrative agendas that have shaped the way we view ballistic missile technology. Three new sections connect our recent, sudden shifts in foreign policy to ongoing historical patterns. Whether cautioning against the "almost neurotic pursuit of absolute security" or examining the powerful influence of religion on military buildup, Ernest J.Yanarella uncovers the deeply ingrained attitudes that will determine the future of American missile defense.

History suggests that the existence of a weapon leads to its eventual use in war, as illustrated by the dropping of the atomic bomb on the Japanese cities of Hiroshima and Nagasaki in 1945. At the opening of the atomic age, scientists, political analysts, generals, and politicians were haunted by the idea that nuclear wars could not be won; both sides would be virtually destroyed. The stakes of the game have only continued to rise as the club of nations currently possessing nuclear arms has become less and less exclusive: the United States, the Soviet Union/Russia, England, France, China, Israel, India, Pakistan, and North Korea. Following a detailed analysis of this timely issue, Nuclear Nonproliferation explores the threat of nuclear production and the potential for solutions in four regions of the world--the United States, South Asia (India and Pakistan), the Middle East (Israel, Iraq, and Iran), and East Asia (North Korea).

Recent discoveries in psychology and neuroscience have improved our understanding of why our decision making processes fail to match standard social science assumptions about rationality. As researchers such as Daniel Kahneman, Amos Tversky, and Richard Thaler have shown, people often depart in systematic ways from the predictions of the rational actor model of classic economic thought because of the influence of emotions, cognitive biases, an aversion to loss, and other strong motivations and values. These findings about the limits of rationality have formed the basis of behavioral economics, an approach that has attracted enormous attention in recent years. This collection of essays applies the insights of behavioral economics to the study of nuclear weapons policy. Behavioral economics gives us a more accurate picture of how people think and, as a consequence, of how they make decisions about whether to acquire or use nuclear arms. Such decisions are made in real-world circumstances in which rational calculations about cost and benefit are intertwined with complicated emotions and subject to human limitations. Strategies for pursuing nuclear deterrence and nonproliferation should therefore, argue the contributors, account for these dynamics in a systematic way. The contributors to this collection examine how a behavioral approach might inform our understanding of topics such as deterrence, economic sanctions, the nuclear nonproliferation regime, and U.S. domestic debates about ballistic missile defense. The essays also take note of the limitations of a behavioral approach for dealing with situations in which even a single deviation from the predictions of any model can have dire consequences.

Set against a backdrop of terrorism, rogue states, non-conventional warfare, and deteriorating diplomacy, this encyclopedia offers a comprehensive, multidisciplinary, up-to-date reference on the recent history and contemporary practice of arms control and nonproliferation. \* 30 illustrations and photos \* Sidebars including brief biographical profiles and quotations \* Charts and graphs \* Primary documents \* Timelines \* Glossary and list of acronyms

Nuclear weapons are here to stay. They have survived into the twenty-first century as instruments of influence for the US, Russia, and other major military powers. But, unlike the Cold War era, future nuclear forces will be developed and deployed within a digital-driven world of enhanced conventional weapons. As such, established nuclear powers will have smaller numbers of nuclear weapons for the purpose of deterrence working in parallel with smarter conventional weapons and elite military personnel. The challenge is to agree proportional reductions in nuclear inventories or abstinence requiring an effective nonproliferation regime to contain aspiring or threshold nuclear weapons states. This is the most comprehensive view of nuclear weapons policy and strategy currently available. The author's division of the nuclear issue into the three ages is a never seen before analytical construct. With President Obama reelected, the reduction and even elimination of nuclear weapons will now rise to the top of the agenda once more. Moreover, given the likelihood of reductions in US defense spending, the subject of the triad, which is covered in Chapter One, will no doubt be an important subject of debate, as will the issue of missile defense, covered in Chapter 10. This book provides an excellent analysis of the spread of nuclear weapons in Asia and the Middle East and the potential dangers of a North Korean or Iranian breakout, subjects that dominate current policy debates.
