Unlike traditional information systems which work by issuing requests and waiting for responses, event-driven systems are designed to process events as they occur, allowing the system to observe, react dynamically, and issue personalized data depending on the recipient and situation. Event Processing in Action introduces the major concepts of event-driven architectures and shows how to use, design, and build event processing systems and applications. Written for working software architects and developers, the book looks at practical examples and provides an in-depth explanation of their architecture and implementation. Since patterns connect the events that occur in any system, the book also presents common event-driven patterns and explains how to detect and implement them. Throughout the book, readers follow a comprehensive use case that incorporates all event processing programming styles in practice today. Purchase of the print book comes with an offer of a free PDF, ePub, and Kindle eBook from Manning. Also available is all code from the book.

David Stifter's Sengóidélc (SHAN-goy-thelg) provides a comprehensive introduction to Old Irish grammar and metrics. As an introductory text to the Irish language spoken around the eighth century C.E., this essential volume, covering all aspects of the grammar in a clear and intuitive format, is ideally suited for use as a course book or as a guide for the independent learner. This handbook also will be an essential reference work for students of Indo-European philology and historical linguistics. Stifter leads the novice through the idiosyncrasies of the language, such as initial mutations and the double inflection of verbs. Filled with translation exercises based on selections from Old Irish texts, the book provides a practical introduction to the language and its rich history. Sengóidélc opens the door to the fascinating world of Old Irish literature, famous not only for the Táin Bó Cúailnge (The Cattle Raid of Cúailnge) and its lyrical nature poetry but also as a major source for the political and legal history of Ireland. Stifter's step-by-step approach and engaging style make his book an ideal tool for both the self taught individual and the classroom environment. It will be of interest to beginning students of Old and Middle Irish, to scholars of Irish history, Celtic culture, and comparative linguistics, and to readers of Irish literature.

Laboratory Investigations in Molecular Biology presents well-tested protocols in molecular biology that are commonly used in currently active research labs. It is an ideal laboratory manual for college level courses in molecular biology. Because of the modular organization of the manual, laboratory courses can be assembled that would be ideal for science professionals, graduate students, undergraduate students and even advanced high school students in AP courses. The manual is also intended to be useful as a laboratory "bench reference". The experiments are designed to guide students through realistic research projects and to provide students with instruction in methods and approaches that can be immediately translated into research projects conducted in modern research laboratories. Although these experiments have been conducted and optimized over 20 years of teaching the New England Biolabs Molecular Biology Summer Workshops, they are real research projects, not "canned" experiments. Based on extensive teaching experience using these protocols, the authors have found that conducting these experiments as described in these protocols serves to effectively instruct students and science professions in the basic methods of molecular biology. An additional unique feature is that the protocols described in the manual are accompanied by available reagent kits that provide quality-tested, pre-packaged reagents to ensure the successful application of these protocols in a laboratory course setting.
